UNITED STATES DISTRICT COURT  
SOUTHERN DISTRICT OF NEW YORK

----- X  
:  
IN RE: METHYL TERTIARY BUTYL :  
ETHER ("MTBE") PRODUCTS :  
LIABILITY LITIGATION :  
----- :

OPINION AND ORDER

Master File No. 1:00-1898  
MDL 1358 (SAS)  
M21-88

This document relates to:

*County of Suffolk, et al. v. Amerada Hess Corp. et al.*, 04 Civ. 5424

*United Water New York Inc. v. Amerada Hess Corp., et al.*, 04 Civ. 2389

----- X  
SHIRA A. SCHEINDLIN, U.S.D.J.:

I. INTRODUCTION

Methyl tertiary butyl ether ("MTBE") is a gasoline additive that has contaminated groundwater throughout the United States. One of the problems with MTBE is that it can make water undrinkable due to its turpentine-like taste and odor.<sup>1</sup> In this multidistrict litigation, three plaintiffs responsible for providing water to the public in the state of New York (Suffolk County Water Authority, the

---

<sup>1</sup> See U.S. Env'tl. Prot. Agency, *Achieving Clean Air and Clean Water: The Report of the Blue Ribbon Panel on Oxygenates in Gasoline* 13, 77 (1999) ("The turpentine-like taste and odor of MTBE . . . can make such drinking water unacceptable to consumers.") available at <http://www.epa.gov/oms/consumer/fuels/oxypanel/r99021.pdf>.

County of Suffolk, and United Water of New York) have sued various oil companies after their water became contaminated with MTBE.

At trial, plaintiffs propose to offer the expert testimony of Dr. William S. Cain to testify about the level at which people can perceive MTBE in their water because of its odor or taste. According to Dr. Cain:

It is my opinion that MTBE can be detected by smell and/or taste in drinking water at levels at or below 1 part per billion (ppb). At concentrations at or below 1 ppb, MTBE can impart a distinctive taste and odor to water.<sup>2</sup>

Defendants have filed a motion *in limine* to exclude Dr. Cain's testimony on the ground that it does not satisfy the requirements of Rule 702 of the Federal Rules of Evidence for expert testimony.<sup>3</sup> In particular, defendants argue that Dr. Cain's

---

<sup>2</sup> 2/1/07 Expert Report of William S. Cain, Ph.D. ("Cain Report") at 2. *See also* 5/25/07 Expert Report of William S. Cain, Ph.D. – Rebuttal at 1 ("Cain Rebuttal") ("As I stated in my First Report, to assert my opinions, I have reviewed various studies of how well human beings can perceive the odor and flavor of weak concentrations of MTBE in water. I have concluded that more than one existing study can be interpreted as supporting a conclusion of detection of the material at or below 1 part per billion (1 ppb). Nothing in the McGuire Report changes my opinions and conclusions.").

<sup>3</sup> *See* Defendants' Notice of Joint Motion and Motion *In Limine* to Exclude the Opinion of Plaintiffs' Expert William S. Cain, Ph.D. ("Def. Mem."). The motion *in limine* is filed pursuant to Rule 104. *See* Fed. R. Evid. 104(a) ("Preliminary questions concerning the qualification of a person to be a witness, the existence of a privilege, or the admissibility of evidence shall be determined by the court, subject to the provisions of subdivision (b) . . .").

testimony is not “the product of reliable principles and methods.”<sup>4</sup> For the reasons below, defendants’ motion is granted.<sup>5</sup>

## II. BACKGROUND

### A. MTBE Contamination of Water

MTBE “is an oxygenate, meaning it increases the oxygen content of the gasoline. It is also a source of octane in gasoline.”<sup>6</sup> Companies began to add MTBE to gasoline in 1979,<sup>7</sup> and “[t]he use of MTBE significantly increased after 1990, when Congress established the Reformulated Gasoline Program (‘RFG Program’) as part of its amendments to the Clean Air Act (‘CAA’).”<sup>8</sup> As enacted in 1990, “the RFG Program required the use of reformulated gasoline containing at

---

<sup>4</sup> Fed. R. Evid. 702.

<sup>5</sup> Dr. Cain has also submitted two reports that apply his taste/odor threshold to determine which wells have been damaged. *See* 5/8/07 Expert Report of William S. Cain, Ph.D. - Well Specific Opinions (“Well Specific Rpt.”); 8/23/07 Supplemental Expert Report of William S. Cain, Ph.D. – Well Specific Opinions. Because these reports merely apply Dr. Cain’s inadmissible opinion to specific wells, these opinions are also inadmissible.

<sup>6</sup> Methyl Tertiary-Butyl Ether (MTBE): Advance Notice of Intent to Initiate Rulemaking Under the Toxic Substances Control Act to Eliminate or Limit the Use of MTBE as a Fuel Additive in Gasoline (“MTBE Advance Notice of Intent”), 65 Fed. Reg. 16,094, 16,094 (Mar. 24, 2000).

<sup>7</sup> *See* Application for Methyl Tertiary Butyl Ether, Decision of the Administrator, 44 Fed. Reg. 12,242, 12,243 (Mar. 6, 1979).

<sup>8</sup> *In re MTBE*, 488 F.3d 112, 114 (2d Cir. 2007).

least 2 percent chemical oxygen by weight in certain metropolitan areas with high summertime smog levels.”<sup>9</sup> “Pursuant to regulations promulgated by the Environmental Protection Agency (‘EPA’) in 1991, MTBE is one of several different oxygenates that may be used to certify gasoline as reformulated.”<sup>10</sup>

“Each year approximately 9 million gallons of gasoline (the equivalent of a full supertanker) are released to the environment in the United States from leaks and spills, according to an estimate by the Alliance for Proper Gasoline Handling.”<sup>11</sup> Gasoline is released into the environment primarily through leaking underground storage tanks, leaking product pipelines, gasoline spills, and exhaust.<sup>12</sup>

---

<sup>9</sup> *Id.*

<sup>10</sup> *Id.*

<sup>11</sup> MTBE Advance Notice of Intent at 16,095.

<sup>12</sup> See *In re MTBE*, 209 F.R.D. 323, 330 n.5 (S.D.N.Y. 2002) (“A government study conducted over an eight-year period from 1993-2000 concluded that releases from underground gasoline storage systems [‘USTs’] are the main source of MTBE groundwater contamination.”); *In re MTBE*, 241 F.R.D. 185 (S.D.N.Y. 2007) (discussing a leaking underground tank in Maryland); *In re MTBE*, 241 F.R.D. 435 (S.D.N.Y. 2007) (discussing a pipeline that released thousands of gallons of gasoline in Illinois); *In re MTBE*, 342 F. Supp. 2d 147, 149 (S.D.N.Y. 2004) (“Water contamination occurs from normal, everyday use of gasoline containing MTBE—e.g., gasoline drips from gas station pumps—and when MTBE is stored in leaking underground tanks. MTBE is also discharged into the air as exhaust as a bi-product of car engine combustion of gasoline containing MTBE.”).

In comparison with other gasoline components, MTBE dissolves easily in water and does not bond well to soil. As a result, once gasoline with MTBE is released into the environment, the chemical travels rapidly and has the ability to contaminate groundwater and underground water reservoirs. MTBE contamination can give water a foul taste and odor, rendering it unfit for human consumption.

### **B. Potential Damage to Plaintiffs' Water Supplies**

After discovering that their water supplies were contaminated with MTBE, plaintiffs sued various companies for their use and handling of the chemical. In particular, "plaintiffs assert claims for: (a) violation of section 8(e) of the Toxic Substances Control Act ("TSCA"); (b) public nuisance; (c) strict liability for design defect; (d) strict liability for failure to warn; (e) negligence; (f) private nuisance; (g) violation of New York's General Business Law; (h) violation of New York's Navigation Law; and (i) trespass."<sup>13</sup>

If the jury should find defendants liable for these claims, it will determine the extent to which MTBE harmed plaintiffs' water supplies. In particular, plaintiffs are harmed when a reasonable owner would begin to remove the MTBE from its water, or otherwise take appropriate action (*e.g.*, masking the

---

<sup>13</sup> *In re MTBE*, 517 F. Supp. 2d 662, 665 (S.D.N.Y. 2007).

taste and odor with chlorine), because of the taste and odor it gives contaminated water.<sup>14</sup>

In determining the harm inflicted on plaintiffs, two points deserve emphasis. *First*, as a matter of law, plaintiffs' water is not harmed merely because its water contains a minuscule amount of MTBE. As this Court has previously explained:

even clean, clear, good-tasting water contains dozens of contaminants at low levels. On its journey through the water cycle as rain, surface water, and groundwater in an aquifer, water collects many contaminants of various types: bacteria, parasites, heavy metals, organic compounds (including MTBE), inorganic compounds, and even radioactive substances.<sup>15</sup>

---

<sup>14</sup> Plaintiffs could be harmed in other ways, which this opinion does not address. For example, the costs of investigation could constitute a harm. In addition, the water could be harmed for reasons that do not involve taste or odor. For example, if MTBE were found to cause cancer, or even suspected of causing cancer, it might require the removal of the chemical from the water. It should be noted that the studies on the effects of ingesting MTBE are sparse. *See* U.S. Env't'l. Prot. Agency, *Oxygenates in Water: Critical Information and Research Needs* 24 (1998) ("Most of the testing and research on the toxicity of oxygenates has been concerned with the effects of *inhaled* MTBE in laboratory animals and human volunteers.") (emphasis in original) available at [http://www.epa.gov/ncea/pdfs/oxy\\_h2o.pdf](http://www.epa.gov/ncea/pdfs/oxy_h2o.pdf). However, new studies on the effects of MTBE, which may include the effects of ingestion, may be published in the future. *See In re MTBE*, 241 F.R.D. 435, 437 (S.D.N.Y. 2007) ("The United States Environmental Protection Agency may have found that MTBE is a 'likely' cause of cancer in humans such as leukemia and lymphoma, although this conclusion has not yet received official agency approval.") (citations omitted).

<sup>15</sup> *In re MTBE*, 2007 WL 1601491, at \*6 (S.D.N.Y. June 4, 2007).

New York does not have a zero-tolerance policy on contaminants in drinking water. “Indeed, the costs associated with a zero-tolerance rule make such a rule impracticable.”<sup>16</sup>

*Second*, the fact that one person in the population can taste or smell MTBE does not mean that plaintiffs’ water supplies have been harmed because it would be unreasonable for a water company to cater to the most sensitive person in the population. People have different abilities to taste or smell MTBE just as they have different abilities to taste or smell any substance.<sup>17</sup> As a result, some people may be able to perceive it at much lower levels than other people but this fact alone does not necessarily mean that plaintiffs’ water supply has been harmed.

The jury must consider the variation in the population’s ability to detect MTBE when determining the extent to which plaintiffs have been harmed. For example, it is conceivable that a jury would conclude that a reasonable company would not take steps to remove MTBE from the water if only 0.1%, 1%,

---

<sup>16</sup> *Id.*

<sup>17</sup> For example, some research indicates that about twenty-five percent of the population qualifies as a “supertaster” – an individual with significantly more sensitive taste receptors. *See* David Leite, “Tales of a Supertaster,” *Best Food Writing 2006* 58, 59 (Holly Hughes, ed. 2006) (discussing the work of Linda Bartoshuk, Ph.D., who researches genetic variation in taste perception at Yale University’s School of Medicine).

10%, or even 25% of the population found it unpleasant to drink depending on the particular circumstances of the case.

In the end, the issue of when the water suppliers are harmed by MTBE contamination is fact-specific in a variety of ways not discussed here. Nonetheless, the fact that there is a wide variation within population of the ability to detect the chemical must be considered by the jury when it determines whether plaintiffs were harmed.

### **III. LEGAL STANDARD FOR ADMITTING EXPERT TESTIMONY**

Rule 702 of the Federal Rules of Evidence provides:

If scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue, a witness qualified as an expert by knowledge, skill, experience, training, or education, may testify thereto in the form of an opinion or otherwise, if (1) the testimony is based upon sufficient facts or data, (2) the testimony is the product of reliable principles and methods, and (3) the witness has applied the principles and methods reliably to the facts of the case.<sup>18</sup>

Because the crux of the defendants' argument is that Dr. Cain's testimony is not "the product of reliable principles and methods," the key issue on this motion is what constitutes a "reliable" method or principle under Rule 702.<sup>19</sup> In this area of

---

<sup>18</sup> Fed. R. Evid. 702.

<sup>19</sup> See, e.g., Def. Mem. at 1 (moving to exclude Dr. Cain's testimony because he is "[a]dmittedly using a methodology never before employed . . .").

law, as in others, “a page of history is worth a volume of logic.”<sup>20</sup> Accordingly, I will briefly review the history of the law that this Court must apply to the issue raised by the defendants.<sup>21</sup>

#### **A. The Supreme Court’s Decision in *Daubert***

In 1923, the Court of Appeals for the District of Columbia held in *Frye v. United States*<sup>22</sup> that testimony by an expert witness is only admissible if based on methods that were generally accepted within the appropriate scientific community.<sup>23</sup> *Frye*’s “general acceptance” test became the dominant test in federal courts, which followed common law rules when admitting evidence.

However, in 1975, Congress enacted the Federal Rules of Evidence.<sup>24</sup> Rule 402 provided the new baseline for evaluating the admissibility of evidence and stated: “All *relevant* evidence is admissible, except as otherwise provided by the Constitution of the United States, by Act of Congress, by these rules, or by

---

<sup>20</sup> *New York Trust Co. v. Eisner*, 256 U.S. 345, 349 (1921) (Holmes, J.).

<sup>21</sup> See also Margaret A. Berger, “The Supreme Court’s Trilogy on the Admissibility of Expert Testimony,” Federal Judicial Center, *Reference Manual on Scientific Evidence* 9-38 (2d ed. 2000) (“Berger, Supreme Court’s Trilogy”).

<sup>22</sup> 293 F. 1013 (D.C. Cir. 1923).

<sup>23</sup> *Id.* at 1014.

<sup>24</sup> See Act to Establish Rules of Evidence for Certain Courts and Proceedings, Pub L. No. 93-595, 88 Stat. 1926 (1975).

other rules prescribed by the Supreme Court pursuant to statutory authority.”<sup>25</sup> In addition, Rule 702 stated:

If scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue, a witness qualified as an expert by knowledge, skill, experience, training, or education, may testify thereto in the form of an opinion or otherwise.

In 1993, the Supreme Court held in *Daubert v. Merrell Dow Pharmaceuticals, Inc.*,<sup>26</sup> that the admissibility of expert testimony was governed by the Federal Rules, rather than common law evidentiary rules, and nothing in the language or history of the Rules reflected an intent to incorporate *Frye*’s “general acceptance” test.<sup>27</sup>

As *Daubert* explained, “under the Rules the trial judge must ensure that any and all scientific testimony or evidence admitted is not only relevant,” as

---

<sup>25</sup> See *id.* (emphasis added).

<sup>26</sup> 509 U.S. 579 (1993).

<sup>27</sup> See *id.* at 588 (“Nothing in the text of this Rule establishes ‘general acceptance’ as an absolute prerequisite to admissibility. Nor does respondent present any clear indication that Rule 702 or the Rules as a whole were intended to incorporate a ‘general acceptance’ standard.”). See also *Nimely v. City of New York*, 414 F.3d 381, 395 (2d Cir. 2005) (“It is a well-accepted principle that Rule 702 embodies a liberal standard of admissibility for expert opinions, representing a departure from the previously widely followed, and more restrictive, standard of *Frye v. United States*, 293 F. 1013, 1014 (D.C. Cir. 1923)) (citing *Daubert*); *Amorgianos v. National R.R. Passenger Corp.*, 303 F.3d 256, 265 (2d Cir. 2002).

required by Rule 402, “but reliable.”<sup>28</sup> The Supreme Court derived this test from the text of Rule 702 and the meaning of the word “knowledge.”<sup>29</sup> “[T]he word ‘knowledge’ connotes more than subjective belief or unsupported speculation. The term ‘applies to any body of known facts or to any body of ideas inferred from such facts or accepted as truths on good grounds.’”<sup>30</sup>

The Supreme Court made it clear that “reliable” was a reference to “*evidentiary* reliability—that is, trustworthiness.”<sup>31</sup> Moreover, the Supreme Court limited its discussion “to the scientific context because that [was] the nature of the expertise offered here.”<sup>32</sup> In particular, the Court “examined the characteristics of scientific methodology and set out a non-exclusive list of four factors that bear on whether a technique has been derived by the scientific method.”<sup>33</sup> These non-exclusive four factors included: (1) whether the theory can be and has been tested; (2) whether the theory has been subjected to peer review; (3) any known error rate;

<sup>33</sup> Berger, Supreme Court’s Trilogy at 12.

and (4) general acceptance in the relevant expert community.<sup>34</sup>

**B. The Supreme Court's Decision in *Kumho Tire***

While *Daubert* involved a doctor providing scientific testimony, case law before and after the decision provided numerous examples of non-scientific expertise that might be offered at trial. For example, a witness might be an expert in terms used by drug dealers, handwriting analysis, criminal *modus operandi*, land valuation, check marking identification, drug trafficking operations, agricultural practices, railroad procedures, organized crime jargon, commercial lending practices or attorneys' fee valuation.<sup>35</sup> Likewise, as one commentator wrote in the immediate aftermath of *Daubert*:

There are numerous examples of technical but nonscientific experts whose credentials normally include substantial formal instruction in the techniques of a discipline. Attorneys, historians, and musicians fall into this category. There are also many nonscientific experts who have informally acquired specialized knowledge through practical experience. This category includes auctioneers, bankers, railroad brakemen, businesspersons, carpenters, farmers, security guards, and trapshooters. The courts have even gone to the length of permitting experienced drug users to testify as experts about the

---

<sup>34</sup> See *Daubert*, 509 U.S. at 592-94.

<sup>35</sup> See Brief for United States as Amicus Curiae 18-19, and n.5, *Kumho Tire Co., Ltd. v. Carmichael*, 526 U.S. 137 (1999) (No. 97-1709) available at 1998 WL 541947.

identity of alleged contraband drugs.<sup>36</sup>

In *Kumho Tire Company v. Carmichael*, the Supreme Court held that Rule 702 imposed a basic gatekeeping obligation upon a trial judge when considering *any* expert testimony regardless of whether it involved scientific testimony.<sup>37</sup> The Court again focused on the language of Rule 702 and, in particular, the word “knowledge” which “establishes a standard of evidentiary reliability.”<sup>38</sup> Moreover, “*Daubert* pointed out that Federal Rules 702 and 703 grant expert witnesses testimonial latitude unavailable to other witnesses on the ‘assumption that the expert’s opinion will have a *reliable* basis in the knowledge

---

<sup>36</sup> Edward J. Imwinkelried, “The Next Step After *Daubert*: Developing a Similarly Epistemological Approach to Ensuring the Reliability of Nonscientific Expert Testimony,” 15 *Cardozo L. Rev.* 2271, 2278-79 (1994) (numerous citations omitted). “Nonscientific expert witnesses are not only varied; they frequently appear at modern trials.” *Id.* (discussing two studies that attempted to determine the types of expert witnesses called at criminal trials in the 1960s and civil trials in the 1980s).

<sup>37</sup> The fact that Rule 702 applied to all expert testimony was uncontroversial. See *Kumho Tire*, 526 U.S. at 147. (“The initial question before us is whether this basic gatekeeping obligation applies only to ‘scientific’ testimony or to all expert testimony. We, like the parties, believe that it applies to all expert testimony.”).

<sup>38</sup> *Id.* (“In *Daubert*, the Court specified that it is the Rule’s word ‘knowledge,’ not the words (like ‘scientific’) that modify that word, that ‘establishes a standard of evidentiary reliability.’”) (quoting *Daubert*, 509 U.S. at 589-90).

and experience of his discipline.’”<sup>39</sup> This standard applied to all experts regardless of the type of testimony offered.

The Supreme Court explained:

The objective of [the gatekeeping] requirement is to ensure the reliability and relevancy of expert testimony. It is to make certain that an expert, whether basing testimony upon professional studies or personal experience, employs in the courtroom the same level of intellectual rigor that characterizes the practice of an expert in the relevant field.<sup>40</sup>

In determining whether the expert has satisfied this standard, *Daubert*’s four factors may, or may not, bear on the issue of the reliability of the expert’s methodology. “Life and the legal cases that it generates are too complex to warrant so definitive a match.”<sup>41</sup>

### **C. The 2000 Amendments to Rule 702**

In 2000, the Rules were amended in response to *Daubert* and its progeny including the Supreme Court’s decision in *Kumho Tire*. The following language was added to the end of the Rule: “if (1) the testimony is based upon sufficient facts or data, (2) the testimony is the product of reliable principles and

---

<sup>39</sup> *Id.* at 148 (quoting *Daubert*, 509 U.S. at 592) (emphasis added).

<sup>40</sup> *Id.* at 152.

<sup>41</sup> *Id.* at 151.

methods, and (3) the witness has applied the principles and methods reliably to the facts of the case.”<sup>42</sup> As the Advisory Committee Note to Rule 702 explained:

The amendment affirms the trial court’s role as gatekeeper and provides some general standards that the trial court must use to assess the reliability and helpfulness of proffered expert testimony. Consistent with *Kumho Tire*, the Rule as amended provides that all types of expert testimony present questions of admissibility for the trial court in deciding whether the evidence is reliable and helpful . . . .

Some types of expert testimony will be more objectively verifiable, and subject to the expectations of falsifiability, peer review, and publication, than others. Some types of expert testimony will not rely on anything like a scientific method, and so will have to be evaluated by reference to other standard principles attendant to the particular area of expertise.<sup>43</sup>

---

<sup>42</sup> Fed. R. Evid. 702.

<sup>43</sup> Fed. R. Evid. 702, 2000 Advisory Committee Note.

#### IV. DR. CAIN'S METHODOLOGY IS NOT RELIABLE

The Court has no doubt that “scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence.”<sup>44</sup> Nor does the Court have any doubt that Dr. Cain is “a witness qualified as an expert by knowledge, skill, experience, training, or education.”<sup>45</sup> As his current on-line biography at the University of California, San Diego, explains:

Dr. William S. Cain became professor of surgery (otolaryngology) at the University of California, San Diego in 1994. Dr. Cain received his B.S. from Fordham and his Ph.D. from Brown. He spent 27 years at the John B. Pierce Laboratory at Yale University where he was professor of environmental health and psychology. His research focuses on the human sense of smell and the irritation sense. He has worked on both basic and applied issues of chemosensory perception. His work has had application to indoor air quality, use of odors to warn of hazards, aging and the perception of food, and the evaluation of olfactory functioning in patients. Dr. Cain has served as head of the Association for Chemoreception Sciences and as president of the New York Academy of Sciences. He has been elected fellow in such diverse societies as the American Psychological Association, American Psychological Society, Academy of Indoor Air Sciences, and American Society of Heating, Refrigerating, and Air-Conditioning Engineers. He has served on various panels or committees for the National Institutes of Health and the National Research Council/National Academy of Sciences, most recently the Advisory Group for Strategies to Protect the Health of U.S.

---

<sup>44</sup> Fed. R. Evid. 702.

<sup>45</sup> *Id.*

Forces.<sup>46</sup>

Thus, in determining the admissibility of Dr. Cain's testimony, the key question is whether Rule 702's three criteria are satisfied.

According to the initial expert report submitted by Dr. Cain:

It is my opinion that MTBE can be detected by smell and/or taste in drinking water at levels at or below 1 part per billion (ppb). At concentrations at or below 1 ppb, MTBE can impart a distinctive taste and odor to water.<sup>47</sup>

Dr. Cain reached this conclusion in two steps. *First*, Dr. Cain selected one study to focus on from the dozens of reported studies on the human threshold for detecting MTBE.<sup>48</sup> *Second*, Dr. Cain discussed potential flaws in this study which

---

<sup>46</sup> <http://surgery.ucsd.edu/chemosensory/cain.html>. See also Curriculum Vitae of William S. Cain, Ph.D., attached as Ex. C to Plaintiffs' Response to Defendants' Motion in Limine to Exclude the Opinion of Williams S. Cain, Ph.D. ("Pl. Mem.").

<sup>47</sup> Cain Report at 2.

<sup>48</sup> Dr. Cain provides two reasons for selecting the Stocking Study as the most accurate of the dozens of studies that have been conducted on the taste and odor threshold. *First*, "studies that find higher thresholds for a given material raise more doubts about validity than studies that find lower thresholds" and the Stocking Study found the lowest threshold of the published studies. *Id.* at 4. *Second*, "coarse methodology will yield higher thresholds than more refined methodology." *Id.* However, Dr. Cain offers no support for either of these propositions. As a result, his methodology in selecting the study may be unreliable because it relies solely on the studies' conclusions for selection and declares that the studies with lower thresholds used better methodology. Because his testimony is unreliable for other reasons, I do not address the reliability of his

had found a taste and odor threshold for MTBE of 15 ppb and then applied “correction factors” to lower the threshold for detecting MTBE.<sup>49</sup>

#### A. The Stocking Study

Over the last three decades, there have been more than thirty reported studies on the human threshold for detecting MTBE.<sup>50</sup> Of these many studies, Dr. Cain selected one to serve as the basis for his opinion: a 1998 consumer panel study by Andrew Stocking and others of MTBE odor detection, commissioned by the Oxygenated Fuels Association (the “Stocking Study”).<sup>51</sup>

Fifty-seven people participated in the Stocking Study, which used a protocol based on American Society for Testing and Materials (“ASTM”) method E679-91.<sup>52</sup> The ASTM Method is “a standard and well-accepted methodology” that can “be rigorously duplicated by other researchers.”<sup>53</sup> The study only focused

---

selection in this opinion.

<sup>49</sup> See *id.* at 4-6.

<sup>50</sup> See Def. Mem. at 5.

<sup>51</sup> The engineers who conducted the Stocking Study describe its protocol and results in detail in *Implications of an MTBE Odor Study in Setting Drinking Water Standards* by Andrew J. Stocking *et al.*, 93 J. Am. Water Works Ass’n 95 (March 2001), Ex. F. to Def. Mem.

<sup>52</sup> See *id.* at 101.

<sup>53</sup> *Id.*

on odor. As the authors explained:

It was decided to conduct an odor study in lieu of a taste (flavor) study for two reasons: (1) it was thought an odor study would result in a lower threshold (Young et al, 1996) and (2) there would be no laboratories that would accept the liability of performing a taste (flavor) study without a primary MCL [Maximum Contaminant Level] established by CDHS [California Department of Health Services].<sup>54</sup>

The protocol used for this study involved presenting eight samples to the participants in increasing order: 2, 3.5, 6, 10, 18, 30, 60, and 100 ppb.<sup>55</sup> “The authors agreed that eight trials were the maximum number of trials to which a [participant] could be exposed before olfactory fatigue began to affect results.”<sup>56</sup>

Under the ASTM method used by the study, the participant picked one of three samples as being different from the other samples.<sup>57</sup> Sample solutions of 4 oz each were presented in disposable 7-oz odor-free plastic cups.<sup>58</sup>

Each spiked and blank sample was covered with a clean watch glass. The panelists were instructed to lift each sample . . . . The panelists were allowed to repeat a trial if they were uncertain after

<sup>54</sup> *Id.* (citing W.F. Young *et al.*, *Taste and odor threshold concentrations of possible water contaminants*, 30 Water Res., 331-40 (1996)).

<sup>55</sup> *See id.* at 96, 101.

<sup>56</sup> *Id.* at 101 (citation omitted).

<sup>57</sup> *See id.*

<sup>58</sup> *See id.*

the first time. Once a trial was completed, the panelist replaced the watch glasses and signaled to the consumer testing laboratory staff that he or she was finished. The panelist then indicated on his or her individual scorecard the number of the sample that smelled different from the other two. If the panelist was not able to determine a difference, he or she was directed to guess which sample smelled different.<sup>59</sup>

Once the data was collected, it was analyzed under ASTM method E679-91, according to which:

individual threshold calculations are calculated by taking the geometric mean of the last concentration missed and the first concentration detected, given that all higher concentrations were successfully detected. If a panelist could detect all the concentrations presented, the threshold concentration for that panelist was the geometric mean of 2 µg/L and the next lowest theoretical concentration (1 µg/L). If a panelist did not detect the highest concentration (100 µg/L), it was assumed that the panelist would have detected the next highest theoretical concentration and the threshold was calculated to be 132 µg/L (the geometric mean of 100 and 175 µg/L).<sup>60</sup>

“Individual calculated thresholds ranged from 1.4 to 132 µg/L [ppb].”<sup>61</sup> Indeed, ten of the fifty-seven participants, or approximately eighteen percent, correctly

---

<sup>59</sup> See *id.*

<sup>60</sup> *Id.* at 102-03. It should be noted that µg/L and ppb are interchangeable units of measurement.

<sup>61</sup> *Id.* at 103.

picked the sample that had MTBE at 2 µg/L.<sup>62</sup> At the same time, thirteen of the participants failed to select the sample containing MTBE at 100 µg/L.

“The test panel geometric mean threshold was calculated to be 15 µg/L, and it represents the threshold of approximately 50%” of the participants.<sup>63</sup>

In comparison to other studies,

[t]he geometric means from literature for MTBE in drinking water are as follows:

- from 13.5 to 45.5 µg/L (Shen et al, 1998) for odor,
- 34 µg/L (Young et al, 1996) for odor, and
- 48 µg/L (Young et al, 1996) for taste.<sup>64</sup>

Thus, the authors concluded, the detection threshold found in their study was generally lower than that found in other studies.<sup>65</sup>

#### **B. Dr. Cain’s Proposed Testimony**

In sharp contrast to the Stocking Study, which provided clear definitions and results, Dr. Cain’s testimony is ambiguous, confusing and

---

<sup>62</sup> Whether all of these individuals “detected” MTBE at 2 ppb is unclear given that they were instructed to guess if they were not able to determine a difference between the samples and thus some of the participants may have guessed correctly even though they could not detect a difference.

<sup>63</sup> *Id.*

<sup>64</sup> *Id.* at 104.

<sup>65</sup> *See id.*

inconsistent. In his original report, Dr. Cain concludes that “MTBE *can be detected* by smell and/or taste in drinking water at levels at or below 1 part per billion (ppb).”<sup>66</sup> His use of the passive voice (*i.e.*, “can be detected”) leaves unanswered what percentage of the population can detect MTBE at 1 ppb. A review of Dr. Cain’s reports and his deposition shows that he fails to provide a clear answer to this question.

After reading Dr. Cain’s initial report, it is reasonable to conclude that he is arguing the “threshold” for the population as a whole is 1 ppb, which would imply that more than fifty percent of the population could detect MTBE at this level.<sup>67</sup> Yet, in his Well Specific Report, Dr. Cain puts forward at least six different positions regarding the percentage of the population that can detect MTBE at this level:

- “Had the investigators continued the testing with more trials, I opined [in the previous report], they would have found a lower threshold. With thorough testing, they would likely have found the threshold to lie at 3 ppb instead of the 15 ppb they reported . . . . If the threshold had equaled 3 ppb, then as many as one-third of their subjects would have detected 1 ppb or below.”<sup>68</sup>

---

<sup>66</sup> Cain Report at 2 (emphasis added).

<sup>67</sup> *See id.* at 4.

<sup>68</sup> Well Specific Rpt. at 1.

- “Depending on how one extrapolates the bottom of the curves from Stocking et al., one might conclude that 18% of subjects could detect 0.5 ppb, or a somewhat lower percentage could, perhaps 10%.”<sup>69</sup>
- “When I have opined that MTBE can be detected by a substantial fraction of subjects at 1 ppb or below, I have always defined it as 10% . . . .”<sup>70</sup>
- “When approximately half of the samples in a well exceed 0.25 ppb MTBE, as many as half the people who smell the water might find it different from normal.”<sup>71</sup>
- “A sample taken on February 23, 2004, reached 0.5 ppb . . . . It is, therefore, my conclusion that MTBE could have been detected by some fraction of the population and any taste or odor would have been attributable only to the presence of MTBE.”<sup>72</sup>
- “[T]here is credible scientific support for the ability of some people to detect MTBE at levels as low as 0.04 ppb. Using this figure as a guideline, at least some consumers could have detected MTBE even at levels below 0.5 ppb.”<sup>73</sup>

In his rebuttal report, Dr. Cain states, *inter alia*:

If we use the factor of two to correct for the effect of age, we

---

<sup>69</sup> *Id.* at 5.

<sup>70</sup> *Id.*

<sup>71</sup> *Id.*

<sup>72</sup> *Id.* at 7.

<sup>73</sup> *Id.* at 9.

would reduce our estimated threshold from 3 ppb to essentially 1.5 ppb. We would expect about 50% of young adults, up to about 35 years of age, to have thresholds lower than that.<sup>74</sup>

Finally, during his deposition, Dr. Cain stated that fifty percent of the population would detect MTBE at levels ranging from 0.5 to 1 ppb.<sup>75</sup> In particular, Dr. Cain testified:

Q. Okay. Let's assume that you've got that kind of detection activity going on for the year 2002. My question is whether you can approximate, to a reasonable degree of scientific certainty, what percentage of [the] customers would have been able to detect the odor of MTBE in that well water?

A. I would say something – probably something above 50 percent of the people.

Q. Okay.

A. Okay.

Q. And can you tell me how that was derived?

A. Well, if I—if I say a significant fraction of .5, I mean – I've said I don't know the exact threshold for MTBE, but I believe it to be in the vicinity of .5 to 1. And these data cover that span.<sup>76</sup>

Dr. Cain's failure to present a consistent opinion about the percentage

---

<sup>74</sup> Cain Rebuttal at 8.

<sup>75</sup> See 8/29/07 Transcript of Deposition of William S. Cain ("Cain Dep.") at 506.

<sup>76</sup> *Id.*

of the population he believes can detect MTBE at 1 ppb, or any other level, severely detracts from his reliability. Indeed, the only consistency in Dr. Cain's testimony is that every well discussed in his reports has been contaminated to such an extent that plaintiffs were harmed – no matter what that level of contamination is. As a result, it appears Dr. Cain is reaching his conclusion first (*i.e.*, MTBE in the well is detectable) and then providing whatever reasons are necessary to support it.

This observation is not surprising given that Dr. Cain does not base his conclusions on any study he conducted or any identifiable methodology. He provides no support for his opinions, other than that discussed below.

**C. Dr. Cain's Methodology for Correcting Errors in the Stocking Study Is Unreliable**

The Stocking Study found a general population threshold of 15 ppb for the detection of MTBE. In contrast, Dr. Cain has opined that MTBE can be detected at 1 ppb. Putting to one side the problems identified above, Dr. Cain has nonetheless failed to use a reliable methodology in reaching this conclusion.

Dr. Cain arrived at his conclusion by identifying three major flaws in the methodology of the Stocking Study and then applying "corrective factors."<sup>77</sup>

---

<sup>77</sup> Cain Report at 4.

The first problem according to Dr. Cain is that the Stocking Study did not test the threshold at which people can *taste* MTBE:

The study dealt with the odor sniffed from solutions and not from solutions taken into the mouth, as would a study of flavor. Stocking, Suffet, McGuire, & Kavanaugh noted, “there were no laboratories available that would accept the liability of performing a taste (flavor) study without a primary MCL (Maximum Contaminant Level) established by CDHS (California Department of Health Services)” (p. 91). Their statement implies that they considered a flavor study of value, as indeed they should have. It is well known that the two modes of presentation of the solutions have an unpredictable relationship. Even if we accepted the validity of the Stocking, Suffet, McGuire, & Kavanaugh study, we would know only half the story, so to speak.<sup>78</sup>

However, Dr. Cain does not address the fact that the authors of the Stocking Study stated that an odor study would result in a *lower* threshold than a taste study and cited supporting research for this conclusion.<sup>79</sup> Instead, Dr. Cain simply states “the two modes of presentation of the solutions have an unpredictable relationship.”<sup>80</sup>

The second problem that Dr. Cain points out is that “participants [in

---

<sup>78</sup> *Id.*

<sup>79</sup> See *Implications of an MTBE Odor Study in Setting Drinking Water Standards* by Andrew J. Stocking *et al.*, 93 J. Am. Water Works Ass’n 95, 101 (March 2001) (citing W.F. Young *et al.*, *Taste and odor threshold concentrations of possible water contaminants*, 30 Water Res., 331-40 (1996)).

<sup>80</sup> Cain Report at 4.

the Stocking Study] only got one opportunity to sniff each concentration” because it used the “ASTM method.”<sup>81</sup> In a study testing detection thresholds of glutaraldehyde, “a colorless, oily, liquid-chemical with a pungent odor,”<sup>82</sup> Dr. Cain compared the ASTM method with another method involving several rounds of testing for each concentration:

In a test of the flavor of glutaraldehyde in drinking water, we compared the threshold that the ASTM method would have yielded, *i.e.*, stopping after one sweep through the test concentrations, with that from more extensive testing of the same genre (Cain & Schmidt, 2002). Our threshold lay almost a factor of five below the ASTM threshold. That is, participants evinced more sensitivity with more testing, hardly surprising.<sup>83</sup>

In other words, in one study by Dr. Cain, as participants were given repeated tastes of glutaraldehyde in water, they were able to detect it at lower thresholds at “almost a factor of five.”<sup>84</sup>

There are a number of problems with dividing the results of the Stocking Study by five to determine the “true” threshold for detecting MTBE but

---

<sup>81</sup> *Id.*

<sup>82</sup> National Institute for Occupational Safety and Health, *Glutaraldehyde* (September 2006) available at <http://www.cdc.gov/niosh/topics/glutaraldehyde>. Glutaraldehyde has a number of applications including the sterilization of medical and dental equipment. *See id.*

<sup>83</sup> Cain Report at 4-5.

<sup>84</sup> *Id.*

the most fundamental one is that it lacks scientific rigor. To begin, transferring the results from a study of one substance to another has no validity. In addition, the glutaraldehyde study tested taste, not odor, detection. Most importantly, Dr. Cain cannot name another scientist who has ever employed, much less approved of, such a method (*i.e.*, dividing the results of one study by five because another study on an unrelated chemical showed that the subjects' threshold decreased by "almost a factor of five" with repeated testing). Nor has Dr. Cain attempted to report this method in any peer-reviewed journal or "in some public way" so that other scientists could offer criticisms or suggestions.<sup>85</sup> Indeed, Dr. Cain has never used it in his day-to-day work, or applied it to any study other than the Stocking Study, which only occurred after he was hired by the plaintiffs as their expert.<sup>86</sup>

Likewise, in his report, Dr. Cain has not addressed whether this correction factor is constant regardless of the type of chemical being tested. For example, in his deposition, Dr. Cain pointed to one study by Pam Dalton at Monell Chemical Senses Center, which showed a 50,000 to 1 change in the results shown by female panelists when repeated tests were given to the participants.<sup>87</sup> At the

---

<sup>85</sup> See Cain Dep. at 128-29, 132.

<sup>86</sup> See *id.* at 132-35, 216-218.

<sup>87</sup> See *id.* at 197-200.

same time, Dr. Cain explains: “I think it was just happenstance that they got it for this one chemical because they haven’t found it for every chemical, but it’s an unbelievable phenomenon if true.”<sup>88</sup>

At most, Dr. Cain is offering an insightful hunch about what would happen had the Stocking Study been designed differently based on his research on a chemical that is unrelated to MTBE. Yet it is well established that an “insightful, even an inspired, hunch” must be excluded if it “lacks scientific rigor.”<sup>89</sup> Of course, this may well “prevent the jury from learning of authentic insights and innovations. That, nevertheless, is the balance that is struck by Rules of Evidence designed not for the exhaustive search for cosmic understanding but for the particularized resolution of legal disputes.”<sup>90</sup>

Of course, even if the Stocking Study’s result of 15 ppb is divided by five that only yields 3 ppb. To reach 1 ppb, Dr. Cain applied a second “correction factor” based on his identification of a third problem with the Stocking Study: it included older participants who presumably had lost some of their ability to detect

---

<sup>88</sup> *Id.* at 197.

<sup>89</sup> *Rosen v. Ciba-Geigy Corp.*, 78 F.3d 316, 319 (7th Cir. 1996).

<sup>90</sup> *Daubert*, 509 U.S. at 597.

odor and taste as they aged.<sup>91</sup> Dr. Cain explains:

Many studies have shown that olfaction and taste deteriorate with age (e.g., Stevens & Cain, 1993). The process begins in middle age and accelerates. To include older participants in a threshold study invites an elevated answer, but just as important increases the variability of distribution and can blur the answer. I cannot assess specifically how to “correct” for the inclusion of this systematically less sensitive fraction of the population.<sup>92</sup>

Despite being unable to “assess specifically how to ‘correct’” for this perceived flaw in his original report, Dr. Cain later explained that he selected a factor of two.<sup>93</sup> Once again, Dr. Cain offers no reliable methodology for his conclusion that a factor of two is appropriate to “correct” for the Stocking Study’s use of older participants.

Finally, Dr. Cain finds support for his conclusion by briefly relying on another study from 1993. Dr. Cain explains:

Despite the claim by Stocking, Suffet, McGuire, & Kavanaugh that 15 µg/L (15 ppb) represents the only scientifically supportable value, another study sponsored by the industry (ARCO Chemicals, UK) presented credible data that: “The concentration at which 70% of an experienced panel can detect

---

<sup>91</sup> See Cain Report at 5-6.

<sup>92</sup> *Id.*

<sup>93</sup> See Cain Dep. at 215-16 (“Q: But have you provided a multiplication or division factor in your interpretation equation on account of the use of older people? A: Yeah, I think I put it in one report, and I estimate it as a factor of 2 . . . . That was the best I could come up with.”).

the flavour of MTBE in water is between 0.04 and 0.06 ppb” (p. 4) (Campden Food and Drink Research Association, 1993). These values lie twenty times lower than 1 ppb. Tests of odor perception yielded 70% detection for aqueous concentrations below one-half a ppb. The testing, though described somewhat sparsely, seems no less credible than that used in the Stocking et al. study. Since the Stocking et al. study did not include concentrations at or below 1 ppb, it could hardly have obtained the values of that study.<sup>94</sup>

The citation to this unpublished study does support Dr. Cain’s conclusion but it does nothing to validate the *methodology* by which he reached his conclusion.

While plaintiffs might offer this 1993 study to the jury, subject to a ruling on any objections that the defendants might raise, it cannot overcome the fact that Dr.

Cain has not relied on a scientific method to reach his conclusion.<sup>95</sup>

---

<sup>94</sup> *Id.* at 6.

<sup>95</sup> Because this motion only involves the admissibility of Dr. Cain’s testimony, I do not address whether the 1993 study would be admissible at trial. However, defendants have raised potential problems with the study. *First*, it was unpublished and not subjected to any peer review. *See* Def. Mem. at 10. *Second*, the Camden Laboratory has twice attempted to replicate the results of the experiment yet been unable to do so. *See id.* (citing Campden & Chorleywood Food Research Ass’n Group, *Flavour and Odour Thresholds of Methyl Tertiary Butyl Ether (MTBE) in Water*, Report No. S/REP/74638 (Jan. 5, 2004), attached as Exhibit J to Def. Mem). The difference between the studies may exist because the latter two studies confirmed the MTBE concentrations in the samples using gas chromatography. *See id.* “Dilution errors as substantial as 100-fold may have occurred in preparation of samples in Campden (1993), since no analytical work was apparently ever done to verify the actual concentrations of the dilutions.” *Id.* (citing I.H. Suffet, “A Re-Evaluation of the Taste and Odour of Methyl Tertiary Butyl Ether (MTBE) in Drinking Water,” 55 *Water Science & Tech.* 265, 270 (2007)).

**D. Dr. Cain's Testimony Fails to Use the Same Level of Intellectual Rigor that Would be Used by a Scientist in His Field**

In the end, Dr. Cain's testimony does not satisfy Rule 702 because he has failed to demonstrate that he is employing "the same level of intellectual rigor that characterizes the practice of an expert in the relevant field."<sup>96</sup> Dr. Cain proposes to offer scientific testimony about the level at which people can detect MTBE in their water. In the context of evaluating scientific evidence, *Daubert* offered four factors to help guide courts in evaluating the admissibility of scientific testimony, none of which Dr. Cain has satisfied. His conclusion and methodology have (1) not been tested, (2) have not been subjected to peer review and publication, (3) have not identified a known or potential rate of error, and (4) have not gained general acceptance in the relevant community.<sup>97</sup> Moreover, given the problems identified above, I am not convinced that Dr. Cain "[has been] as careful as he would be in his regular professional work outside his paid litigation consulting."<sup>98</sup>

Plaintiffs attempt to avoid Dr. Cain's failure to satisfy any of the

---

<sup>96</sup> *Kumho Tire*, 526 U.S. at 152.

<sup>97</sup> *See Daubert*, 509 U.S. at 593-94.

<sup>98</sup> Fed. R. Evid. 702, 2000 Advisory Committee Note (quoting *Sheehan v. Daily Racing Form, Inc.*, 104 F.3d 940, 942 (7th Cir. 1997)).

*Daubert* criteria or otherwise demonstrate the scientific validity of his method by arguing that his “methodology” really involves “his application of education, observation, and 40 years of experience.”<sup>99</sup> Of course, plaintiffs are correct that experts may apply their education, observation and experience in certain contexts and still be found to use a reliable method even without satisfying *Daubert*’s factors.

For example, it might be pointless to ask whether railroad brakemen, carpenters, or experienced drug users have subjected their opinions to peer review and publication or the known rate of error in scientific studies. Yet, courts should still allow such experts to testify so long as they use a reliable method (*i.e.*, trustworthy) and otherwise satisfy Rule 702’s requirements. There is no one formula for distinguishing reliable and unreliable methods for all experts for the simple reason that there are too many fields in which people may have expertise. This is why the Supreme Court explained that the final question to answer is whether the expert “employs in the courtroom the same level of intellectual rigor that characterizes the practice of an expert in the relevant field.”<sup>100</sup>

However, when an expert is offering testimony that is presented as a

---

<sup>99</sup> Pl. Mem. at 1.

<sup>100</sup> *Kumho*, 526 U.S. at 152.

*scientific* conclusion and the expert's method fails to satisfy *any* of the factors identified in *Daubert*, a court should pause and take a hard look before allowing a jury to consider it. Courts are not naive about the fact that some attorneys will incorrectly instruct experts that their "first and most important role is to be an advocate for the party who calls him as a witness."<sup>101</sup> An expert's first and most important duty is to testify truthfully and accurately to the best of his ability and leave the advocacy to the lawyers. But because some experts are misled by their attorneys, or even just mistaken, about their role in litigation, courts must continue to act as a gatekeeper in determining whether to admit the testimony.

In this case, plaintiffs want Dr. Cain to present scientific testimony about the threshold at which people can detect MTBE. As the Supreme Court emphasized in *Daubert*: "In a case involving scientific evidence, *evidentiary reliability* will be based upon *scientific validity*."<sup>102</sup> Dr. Cain's testimony is not based on a method that has *scientific* validity. Indeed, the Court would be surprised if Dr. Cain were to submit such a report to his colleagues for discussion or review, or if he were to use it as a model for his students to follow when

---

<sup>102</sup> *Daubert*, 509 U.S. at 590 n.9 (emphasis in original).

explaining research and studies in his field.<sup>103</sup> As a result, Dr. Cain's proffered opinion that MTBE can be detected by smell or taste in drinking water at levels at or below 1 ppb must be excluded.

## V. CONCLUSION

For the reasons above, defendants' motion *in limine* is granted. The Clerk of the Court is directed to close this motion (docket # 1532).

----- X  
SHIRA A. SCHEINDLIN, U.S.D.J.:

Under Rule 702 of the Federal Rules of Evidence, a party must demonstrate, *inter alia*, that its expert's "testimony is the product of reliable principles and methods."<sup>1</sup> On May 7, 2008, I granted defendants' motion to exclude the testimony of plaintiff's expert Dr. William S. Cain on the ground that his testimony was based on an unreliable method.<sup>2</sup> On May 21, 2008, plaintiffs

---

<sup>1</sup> Fed. R. Evid. 702. The party offering the expert must prove by a "preponderance of proof" that the proffered testimony satisfies Rule 702. *Daubert v. Merrell Dow Pharms.*, 509 U.S. 579, 592 n.10 (1993) (citing *Bourjaily v. United States*, 483 U.S. 171, 175-76 (1987)).

<sup>2</sup> See *In re Methyl Tertiary Butyl Ether ("MTBE") Prods. Liab. Litig.*, No. 04 Civ. 5424, 2008 WL 1971547 (S.D.N.Y. May 7, 2008).

filed a “Motion for Reconsideration and Clarification of the Court’s Opinion.”<sup>3</sup>

On June 2, 2008, defendants filed a brief in response with the Court’s permission.<sup>4</sup>

For the reasons that follow, plaintiffs’ motion is denied in part and granted in part.

## **I. BACKGROUND**

Plaintiffs offered Dr. Cain as an expert to “testify about the level at which people can perceive MTBE in their water because of its odor or taste.”<sup>5</sup>

According to Dr. Cain:

It is my opinion that MTBE can be detected by smell and/or taste in drinking water at levels at or below 1 part per billion (ppb). At concentrations at or below 1 ppb, MTBE can impart a distinctive taste and odor to water.<sup>6</sup>

In reaching this conclusion, Dr. Cain used the following methodology:

---

<sup>3</sup> See Motion for Reconsideration and Clarification Re William S. Cain (“Pl. Mem.”).

<sup>4</sup> See Defendants’ Opposition to Plaintiffs’ Motion for Reconsideration and Clarification Re William S. Cain (“Def. Mem.”). This opposition was submitted on behalf of Lyondell Chemical Company, Equistar Chemicals, LP, Exxon Mobil Corporation, Getty Properties Corp, and Total Petrochemicals USA, Inc.

<sup>5</sup> *In re MTBE*, 2008 WL 1971547, at \*1.

<sup>6</sup> *Id.* at \*1 (quoting 2/1/07 Expert Report of William S. Cain, Ph.D. at 2).

*First*, Dr. Cain selected one study to focus on from the dozens of reported studies on the human threshold for detecting MTBE. *Second*, Dr. Cain discussed potential flaws in this study which had found a taste and odor threshold for MTBE of 15 ppb and then applied “correction factors” to lower the threshold for detecting MTBE.<sup>7</sup>

I found that Dr. Cain’s methodology of applying “correction factors” was unreliable.<sup>8</sup> Plaintiffs wanted “Dr. Cain to present scientific testimony about the threshold at which people can detect MTBE,” but his testimony was “not based on a method that has *scientific* validity.”<sup>9</sup> Indeed, I would be “surprised were Dr. Cain to submit such a report to his colleagues for discussion or review, or if he were to use it as a model for his students to follow when explaining research and studies in his field.”<sup>10</sup> Because “the final question to answer is whether the expert ‘employs in the courtroom the same level of intellectual rigor that characterizes the practice of an expert in the relevant field,’”<sup>11</sup> Dr. Cain’s testimony could not be presented to the jury.

## II. LEGAL STANDARD ON A MOTION FOR RECONSIDERATION

Motions for reconsideration in the Southern District of New York are governed by Local Civil Rule 6.3. Under this rule:

A notice of motion for reconsideration or reargument of a court order determining a motion shall be served within ten (10) days after the entry of the court's determination of the original motion . . . . There shall be served with the notice of motion a memorandum setting forth concisely the matters or controlling decisions which counsel believes the court has overlooked . . . .<sup>12</sup>

Reconsideration is an “extraordinary remedy to be employed sparingly in the interests of finality and conservation of scarce judicial resources.”<sup>13</sup>

“The standard for granting such a motion is strict, and reconsideration will generally be denied unless the moving party can point to controlling decisions or data that the court overlooked—matters, in other words, that might reasonably be expected to alter the conclusion reached by the court.”<sup>14</sup> Thus, “a motion to reconsider should not be granted where the moving party seeks solely to relitigate

---

<sup>12</sup> Local Civ. R. 6.3.

<sup>13</sup> *In re Health Mgmt. Sys., Inc. Sec. Litig.*, 113 F. Supp. 2d 613, 614 (S.D.N.Y. 2000) (quotation marks omitted).

<sup>14</sup> *Shrader v. CSX Transp., Inc.*, 70 F.3d 255, 257 (2d Cir. 1995). *Accord In re BDC 56 LLC*, 330 F.3d 111, 123 (2d Cir. 2003); *Eisemann v. Greene*, 204 F.3d 393, 395 n.2 (2d Cir. 2000) (“To be entitled to reargument, a party must demonstrate that the Court overlooked controlling decisions or factual matters that were put before it on the underlying motion.”) (quotation marks and citation omitted).

an issue already decided.”<sup>15</sup> “A motion for reconsideration is not a substitute for appeal.”<sup>16</sup>

### **III. PLAINTIFFS’ MOTION FOR RECONSIDERATION IS DENIED**

In arguing for reconsideration, plaintiffs offer two arguments. *First*, they contend that Dr. Cain had a “reasonable basis” for selecting the Stocking Study as the starting point for his analysis.<sup>17</sup> *Second*, plaintiffs argue that Dr. Cain’s application of “correction factors” is based on a reliable methodology.

#### **A. Whether Dr. Cain Had a “Reasonable Basis” for Relying on the Stocking Study Is Irrelevant**

In the opinion issued on May 7, 2008, I wrote:

Over the last three decades, there have been more than thirty reported studies on the human threshold for detecting MTBE. Of these many studies, Dr. Cain selected one to serve as the basis for his opinion: a 1998 consumer panel study by Andrew Stocking and others of MTBE odor detection, commissioned by the Oxygenated Fuels Association (the “Stocking Study”).<sup>18</sup>

In a footnote, I also commented that Dr. Cain’s “methodology in selecting the study may be unreliable because it relies solely on the studies’ conclusions for

<sup>15</sup> *Shrader*, 70 F.3d at 257.

<sup>16</sup> *In re MTBE*, No. 00 Civ. 1898, 2007 WL 2979642, at \*2 (S.D.N.Y. Oct. 10, 2007).

<sup>17</sup> *See* Pl. Mem. at 1-7.

<sup>18</sup> *In re MTBE*, 2008 WL 1971547, at \*6.

selection and declares that the studies with lower thresholds used better methodology.”<sup>19</sup>

Plaintiffs spend the first half of their brief arguing that Dr. Cain had a “reasonable basis” for selecting the Stocking Study. While Plaintiffs do not argue that I overlooked any controlling decisions, they do contend that I made one factual mistake. In particular, plaintiffs argue that “[a]s of 2007, approximately *nine* studies had been performed to determine the levels of MTBE in water that can be detected by test subjects . . . .”<sup>20</sup> Because I had relied on the defendants’ representation in their brief when stating that “there have been more than thirty reported studies on the human threshold for detecting MTBE,”<sup>21</sup> defendants respond:

Plaintiffs accuse Defendants of miscalculating the number of reported studies about the taste and odor threshold of MTBE and misleading the Court, claiming that only nine such studies have been performed. What Defendants stated in their *Motion In Limine*, however, was that “more than thirty reported *experiments*” (as opposed to “studies”) have been conducted. Defendants were correct—there have been at least 31 experiments

---

<sup>19</sup> *Id.* at \*6 n.48.

<sup>20</sup> Pl. Mem. at 2.

<sup>21</sup> *In re MTBE*, 2008 WL 1971547, at \*6.

conducted as part of 11 reported studies on the taste and odor threshold of MTBE (not 9 as Plaintiffs contend).<sup>22</sup>

In other words, it appears that I incorrectly used the word “studies” as a synonym for “experiments” in its previous opinion. While there may have been over thirty experiments, there have been less than a dozen reported studies.

However, nothing in my decision to exclude Dr. Cain’s testimony depended on whether there have been nine, eleven or even thirty-one reported studies on the taste and odor threshold of MTBE. As I noted in the opinion, I did not resolve the “the reliability of his selection” of the Stocking Study, because Dr. Cain’s methodology of applying “correction factors” to this one study was unreliable.<sup>23</sup> For the same reason, I will not resolve on this motion whether Dr. Cain used a reliable method in selecting the Stocking Study as the only study on which to base his expert report.<sup>24</sup>

---

<sup>22</sup> Def. Mem. at 8 n.5 (emphasis in original) (citations omitted).

<sup>23</sup> *In re MTBE*, 2008 WL 1971547, at \*6 n.48.

<sup>24</sup> However, it is worth noting that while plaintiffs argue that Dr. Cain had a “reasonable basis” for selecting the Stocking Study, this is not the standard that they must satisfy. Under Rule 702, the question is whether the method used in selecting the study is “reliable,” which means plaintiffs must demonstrate that Dr. Cain was using “the same level of intellectual rigor that characterizes the practice of an expert in the relevant field” when he selected the Stocking Study. *Kumho*, 526 U.S. at 152.

**B. Using “Correction Factors” Is an Unreliable Method**

In the previous opinion, I summarized Dr. Cain’s methodology by stating :

The Stocking Study found a general population threshold of 15 ppb for the detection of MTBE. In contrast, Dr. Cain has opined that MTBE can be detected at 1 ppb . . . . Dr. Cain arrived at his conclusion by identifying three major flaws in the methodology of the Stocking Study and then applying “corrective factors.”<sup>25</sup>

As I explained: “There are a number of problems with dividing the results of the Stocking Study by five to determine the ‘true’ threshold for detecting MTBE but the most fundamental one is that it lacks scientific rigor.”<sup>26</sup> Because the critical question is whether Dr. Cain’s methodology uses “the same level of intellectual rigor that characterizes the practice of an expert in the relevant field,”<sup>27</sup> I further explained:

Most importantly, Dr. Cain cannot name another scientist who has ever employed, much less approved of, such a method (*i.e.*, dividing the results of one study by five because another study on an unrelated chemical showed that the subjects’ threshold decreased by “almost a factor of five” with repeated testing). Nor has Dr. Cain attempted to report this method in any peer-reviewed journal or “in some public way” so that other scientists could

---

<sup>25</sup> *In re MTBE*, 2008 WL 1971547, at \*9.

<sup>26</sup> *Id.*

<sup>27</sup> *Kumho*, 526 U.S. at 152.

offer criticisms or suggestions. Indeed, Dr. Cain has never used it in his day-to-day work, or applied it to any study other than the Stocking Study, which only occurred after he was hired by the plaintiffs as their expert.<sup>28</sup>

In their motion for reconsideration, plaintiffs reiterate the problems that Dr. Cain identified with the Stocking Study. For example, plaintiffs argue that the Stocking Study only gave subjects one opportunity to sniff each concentration of water containing MTBE. Dr. Cain “opined that if those [subjects] had been given more opportunities to sniff each concentration, the panelists would have been able to detect lower concentrations.”<sup>29</sup> Plaintiffs argue that this phenomenon has been repeatedly documented.<sup>30</sup> Likewise, plaintiffs again point out that the Stocking Study included older participants who presumably had lost some of their ability to detect odor and taste. “Dr. Cain testified that he estimated a reduction factor of two to account for the older participants.”<sup>31</sup>

Although Dr. Cain may have identified valid flaws in the Stocking Study, plaintiffs are unable to show that these flaws warrant the application of “correction factors” to the study. Their arguments fail to show that Dr. Cain

---

<sup>28</sup> *In re MTBE*, 2008 WL 1971547, at \*9.

<sup>29</sup> Pl. Mem. at 8.

<sup>30</sup> *See id.* at 8-11.

<sup>31</sup> *Id.* at 11.

“employs . . . the same level of intellectual rigor that characterizes the practice of an expert in the relevant field.”<sup>32</sup> Indeed, plaintiffs apparently concede that Dr. Cain’s method has “(1) not been tested, (2) [has] not been subjected to peer review and publication, (3) [has] not identified a known or potential rate of error, and (4) [has] not gained general acceptance in the relevant community.”<sup>33</sup> Plaintiffs have still not named “another scientist who has ever employed, much less approved of, such a method.”<sup>34</sup> In fact, plaintiffs do not even argue that prior to this litigation Dr. Cain used “correction factors” in his work.<sup>35</sup>

In short, I excluded Dr. Cain’s opinion from trial because plaintiffs failed to show that he was using “the same level of intellectual rigor that characterizes the practice of an expert in the relevant field”<sup>36</sup> when he applied “correction factors” to the Stocking Study. Plaintiffs do not point out any

---

<sup>32</sup> *Kumho*, 526 U.S. at 152.

<sup>33</sup> *In re MTBE*, 2008 WL 1971547, at \*11 (citing *Daubert*, 509 U.S. at 593-94).

<sup>34</sup> *Id.* at \*9.

<sup>35</sup> While plaintiffs have argued that Dr. Cain “based his opinion here on work performed well before his involvement with MTBE litigation,” Pl. Mem. at 12, this is obviously different from arguing that, prior to this litigation, Dr. Cain has used “correction factors” in his day-to-day work.

<sup>36</sup> *Kumho*, 526 U.S. at 152.

controlling decisions or material facts that I overlooked in reaching this decision.

Their motion for reconsideration is therefore denied.

#### **IV. PLAINTIFFS' MOTION FOR CLARIFICATION IS DENIED**

At the end of their motion, plaintiffs write:

If the Court denies this request [for reconsideration], however, Plaintiffs ask the Court to clarify its May 7, 2008 ruling granting Defendants' motion in limine to specify that Dr. Cain may still offer certain opinions at trial. Defendants' motion challenges only the correction of the Stocking data (as discussed above); Dr. Cain should, therefore, be allowed to offer at the very least any opinions that do not rely on the challenged correction.

For example, Dr. Cain reviewed data provided by SCWA and offered opinions about the levels of other chemicals found in SCWA drinking water. To arrive at these opinions, Dr. Cain simply looked up published threshold values for those chemicals. Ex. F (Cain Depo.) at 343. He did not apply any further reduction factors. *Id.* at 346-349. Those opinions were not challenged by Defendants and have nothing to do with his opinion about the proper "threshold" value for MTBE.<sup>37</sup>

Defendants oppose this request and maintain that "Dr. Cain's opinions should be excluded in their entirety."<sup>38</sup>

Plaintiffs' motion for "clarification" is not properly submitted under Local Civil Rule 6.3, which only allows a "motion for reconsideration or

---

<sup>37</sup> Pl. Mem. at 13.

<sup>38</sup> Def. Mem. at 11.

reargument of a court order.”<sup>39</sup> The Rule does not allow a party to move for “clarification.” Indeed, the only obvious rule that allows for clarification of a court’s order is Rule 60 of the Federal Rules, but even this rule does not permit the type of clarification that plaintiffs are seeking in their motion.

In particular, Rule 60 allows a court to clarify a previous order because it gives a court the power to correct “a mistake arising from oversight or omission whenever one is found in a judgment, order, or other part of the record.”<sup>40</sup> Rule 60(a) “permits the correction not only of clerical mistakes, but also of inadvertent errors arising from oversight or omission.”<sup>41</sup> “The general purpose of Rule 60(a) is to afford courts a means of modifying their judgments in

---

<sup>39</sup> Local Civ. R. 6.3.

<sup>40</sup> Fed. R. Civ. P. 60(a). While Rule 60(b)(6) is a catch-all provision that authorizes the court to relieve a party from an order for “any other reason that justifies relief,” Fed. R. Civ. P. 60(b), courts have found that “[r]elief is available under Rule 60(b)(6) only where exceptional circumstances have denied the moving party a full and fair opportunity to litigate his claim and have prevented the moving party from receiving adequate redress.” *Harley v. Zoesch*, 413 F.3d 866, 871 (8th Cir. 2005).

<sup>41</sup> *In re Marc Rich & Co. A.G. v. United States*, 739 F.2d 834, 836 (2d Cir. 1984) (internal quotation omitted).

order to ensure that the record reflects the actual intentions of the court.”<sup>42</sup> As the Second Circuit has explained:

The relevant distinction is “between what is erroneous because the thing spoken, written or recorded is not what the person intended to speak, write or record, and what is erroneous because the person later discovers that the thing said, written or recorded was wrong. The former comes within Rule 60(a); the latter does not.”<sup>43</sup>

Thus, even if plaintiffs had submitted this motion under Rule 60(a), it would be denied because plaintiffs are not arguing that the opinion issued on May 7, 2008, contains a mistake, error or omission that does not reflect the Court’s intent in issuing it.

## **V. DR. CAIN MAY GIVE LIMITED TESTIMONY AT TRIAL**

What plaintiffs really seek is not “clarification” but permission to use some portion of Dr. Cain’s testimony in light of this Court’s determination that applying “correction factors” to a scientific study is an unreliable method under Rule 702. This is understandable given my previous determination that:

The Court has no doubt that “scientific, technical, or other specialized knowledge will assist the trier of fact to understand

---

<sup>42</sup> *Ferguson v. Lion Holding, Inc.*, No. 02 Civ. 4258, 2007 WL 2265579, at \*3 (S.D.N.Y. Aug. 6, 2007).

<sup>43</sup> *In re Marc Rich*, 739 F.2d at 837 (quoting *Allied Materials Corp. v. Superior Prods. Co.*, 620 F.2d 224, 226 (10th Cir. 1980)).

the evidence.” Nor does the Court have any doubt that Dr. Cain is “a witness qualified as an expert by knowledge, skill, experience, training, or education.”<sup>44</sup>

I will therefore treat plaintiffs’ request as a *motion in limine*, “a motion that the Supreme Court has recognized as stemming from the ‘district court’s inherent authority to manage the course of trials,’”<sup>45</sup> to admit portions of Dr. Cain’s testimony at trial in light of the Court’s previous opinion.

Having again reviewed the reports submitted by Dr. Cain, he may testify about the following. *First*, Dr. Cain may testify about factual issues that have not been disputed by defendants. This testimony is very limited. For example, Dr. Cain could testify about the taste and odor thresholds of other chemicals found in plaintiffs’ well water, based on reported thresholds in any well known scientific treatise. In other words, Dr. Cain could testify that “the value for chlorine in the book is 5, and what is in the well is 2, then it is my expert opinion that [the chemical] wouldn’t be tasted because it is below the threshold values for

<sup>45</sup> *In re MTBE*, 517 F. Supp. 2d at 666-67 (quoting *Luce v. United States*, 469 U.S. 38, 41 n.4 (1984) (treating defendants’ motion, which was improperly filed as a summary judgment motion under Rule 56, as a motion *in limine*)).

chlorine.”<sup>46</sup> *Second*, if the defendants offer the Stocking Study as evidence during the trial, plaintiffs will be permitted to use Dr. Cain as a rebuttal witness to testify about the flaws in the study.<sup>47</sup> However, even if Dr. Cain is testifying as a rebuttal witness, he may not testify about the levels at which he believes people can detect MTBE since the method he used to calculate those levels is unreliable.

## VI. CONCLUSION

Plaintiffs’ motion is denied in part and granted in part. The Clerk of the Court is directed to close this motion (docket ## 1843 and 1862).

ORDER

Master File No. 1:00-1898  
MDL 1358 (SAS)  
M21-88

This document relates to:

Tonneson, et al. v. Sunoco, Inc., et al., 03  
Civ. 8284  
Basso, et al. v. Sunoco, Inc., et al., 03 Civ.  
9050  
----- X

SHIRA A. SCHEINDLIN, U.S.D.J.:

Plaintiffs are residents and business owners who live near two gasoline stations in the hamlet of Fort Montgomery, New York. After discovering that the groundwater wells that they own or use had been contaminated with a gasoline additive, methyl tertiary butyl ether ("MTBE"), plaintiffs brought these actions against the owners and suppliers of the gas stations.<sup>1</sup> At trial, plaintiffs propose to offer the expert testimony of Dr. William S. Cain to testify that "(1) MTBE can be detected by taste and odor at levels in drinking water of less than 1

---

<sup>1</sup> See generally *In re MTBE Prods. Liab. Litig.*, 528 F. Supp. 2d 303, 306-08 (S.D.N.Y. 2007) (discussing the background of this action).

part per billion (ppb), and (2) [people] exposed to water from plaintiffs' wells have detected contamination from MTBE."<sup>2</sup>

Defendants have filed a motion to exclude Dr. Cain's testimony on the ground that it does not satisfy the requirements of Rule 702 of the Federal Rules of Evidence.<sup>3</sup> Dr. Cain's proposed testimony is identical to the testimony offered in a related case in this multi-district litigation.<sup>4</sup> In granting the motion to exclude that testimony, I explained:

Dr. Cain's testimony [about the taste and odor threshold for MTBE] is not based on a method that has *scientific* validity. Indeed, the Court would be surprised if Dr. Cain were to submit such a report to his colleagues for discussion or review, or if he were to use it as a model for his students to follow when explaining research and studies in his field. As a result, Dr. Cain's proffered opinion that MTBE can be detected by smell or taste in drinking water at levels at or below 1 ppb must be excluded.<sup>5</sup>

---

<sup>2</sup> Plaintiffs' Response to Defendants' Joint Motion *In Limine* to Exclude the Testimony of William S. Cain, Ph.D. at 2 (citing Expert Report of William S. Cain, Ph.D. at 3).

<sup>3</sup> See Defendants' Memorandum of Law in Support of Defendants' Joint Motion *In Limine* to Exclude the Testimony of William S. Cain, Ph.D. at 1-9; Defendants' Reply in Support of Defendants' Joint Motion *In Limine* to Exclude the Testimony of William S. Cain, Ph.D. at 1-8.

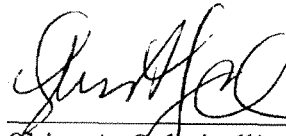

<sup>4</sup> There are some stylistic differences between the two expert reports submitted by Dr. Cain, but the substance of each opinion is the same.

<sup>5</sup> *In re MTBE*, 2008 WL 1971547, at \*12 (S.D.N.Y. May 7, 2008) (emphasis in original).

In addition, because Dr. Cain's proposed testimony that people exposed to water from plaintiffs' wells have detected contamination from MTBE "merely appl[ies] Dr. Cain's inadmissible opinion to specific wells,"<sup>6</sup> it must also be excluded.

Defendants' motion is therefore granted. The Clerk of the Court is directed to close this motion (docket #1755).

SHIRA A. SCHEINDLIN, U.S.D.J.:	

On May 7, 2008, I granted defendants' motion to exclude the testimony of Dr. William S. Cain in *County of Suffolk v. Arnerada Hess Corp.*, 04 Civ. 5424.<sup>1</sup> Relying on that Opinion, I granted defendants' motion to exclude the testimony of Dr. Cain on May 19, 2008 in the actions named above ("*Tonneson*"). Plaintiffs in *County of Suffolk* have filed a motion for reconsideration, which I have denied in part and granted in part. Plaintiffs in *Tonneson* now request that the Court reconsider its order excluding Dr. Cain.

---

<sup>1</sup> See *In re Methyl Tertiary Butyl Ether ("MTBE") Prods. Liab. Litig.*, No. 04 Civ. 5424, 2008 WL 1971547 (S.D.N.Y. May 7, 2008).

The *Tonneson* plaintiffs “adopt and incorporate by reference the arguments and supporting documents of the *County of Suffolk* plaintiffs.”<sup>2</sup> In addition:

[the *Tonneson* plaintiffs] emphasize that Dr. Cain did not propose to offer an opinion regarding a “threshold” level for MTBE in the instant cases. Rather, Dr. Cain proposed to offer his opinion that MTBE can be detected at levels of 1 ppb or less.

The Court’s opinion in *County of Suffolk* stated: “After reading Dr. Cain’s initial report, it is reasonable to conclude that he is arguing the ‘threshold’ for the population as a whole is 1 ppb, which would imply that more than fifty percent of the population could detect MTBE at this level.” Dr. Cain’s proffered opinion in [the instant case] does not propose to testify to a “threshold” level of 1 ppb for MTBE. Rather, he proposes to testify to the fact that MTBE can be detected at levels of 1 ppb or less. As part of that testimony, he would address data reported in several studies including the Stocking Study.<sup>3</sup>

In my Opinion issued on May 7, 2008, I recognized that Dr. Cain never stated that 1 ppb is the threshold detection level for MTBE, but rather opined that MTBE “can be detected” at 1 ppb or below.<sup>4</sup> I also noted, however,

---

<sup>2</sup> Plaintiffs’ Motion for Clarification and Clarification Re William S. Cain, Ph.D at 2.

<sup>3</sup> *Id.*

<sup>4</sup> *In re MTBE*, 2008 WL 1971547, at \*1 (quoting 2/1/07 Expert Report of William S. Cain, Ph.D. (“Cain Report”) at 2). I noted that the “threshold” detection level as used in scientific studies is not the actual lowest individual detection level, but rather the geometric mean of each participant’s lowest

that Dr. Cain's opinion was not sufficiently clear on this point. I wrote that Dr. Cain's "use of the passive voice . . . leaves unanswered what percentage of the population can detect MTBE at 1 ppb" and noted that his report sets forth "at least six different positions regarding the percentage of the population that can detect MTBE at this level."<sup>5</sup>

Most importantly, Dr. Cain reached his conclusion about the level at which MTBE can be detected by applying correction factors to the *threshold* level for MTBE found in another study. Therefore, although Dr. Cain never opines that the *threshold* at which MTBE can be detected is 1 ppb, his methodology leads one to believe that "he is arguing the 'threshold' for the population as a whole is 1 ppb."<sup>6</sup> Indeed, although plaintiffs in the *County of Suffolk* action (which the *Tonneson* plaintiffs have incorporated by reference) write that the distinction between detection and threshold "is critical," Dr. Cain does not make this distinction clear in his expert report.<sup>7</sup>

---

detection level, and represents the level at which approximately fifty percent of the population can detect the chemical. *Id.* at \*7.

<sup>5</sup> *Id.* at \*6.

<sup>6</sup> *Id.*

<sup>7</sup> *County of Suffolk* Plaintiffs' Motion for Reconsideration and Clarification Re William S. Cain, Ph.D at 4.

There are at least two problems with Dr. Cain's failure to clearly distinguish between a threshold level as defined in the Stocking Study on which he relies and his own opinion that "some portion of the population can detect MTBE in water at or below 1 ppb."<sup>8</sup> The first is that it demonstrates that Dr. Cain is not using "the same level of intellectual rigor that characterizes the practice of an expert in the relevant field."<sup>9</sup> I have no doubt that his colleagues would demand more clarity from Dr. Cain if he were to submit such a report to them for discussion or review. The second problem is that any value his testimony might have for the jury is substantially outweighed by the danger that it will confuse the jury.<sup>10</sup>

Furthermore, plaintiffs' argument ignores the reason for my ruling that Dr. Cain's expert testimony must be excluded from trial: he did not employ a reliable methodology to reach his conclusions. Plaintiffs place too much weight on the fact that Dr. Cain's conclusion (*i.e.*, "some people" can detect MTBE at 1 ppb) appears plausible once the perceived flaws in the Stocking Study are

---

<sup>8</sup> *Id.* at 4 n.5.

<sup>9</sup> *Kumho Tire Co., Ltd. v. Carmichael*, 526 U.S. 137, 152 (1999).

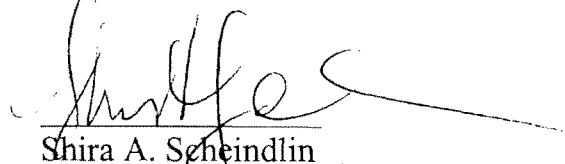

<sup>10</sup> *See* Fed. R. Evid. 403 ("Although relevant, evidence may be excluded if its probative value is substantially outweighed by the danger of unfair prejudice, confusion of the issues, or misleading the jury . . .").

discussed. The Supreme Court has clearly instructed judges to focus on an expert's "principles and methodology, not on the conclusions that they generate."<sup>11</sup> In this case, regardless of whether he concludes that 1 ppb is a threshold or simply a level at which some people can detect MTBE, Dr. Cain's opinion is not "the product of reliable principles and methods" and therefore it must be excluded.<sup>12</sup>

Nonetheless, in the *County of Suffolk* action, I identify a very limited amount of testimony that Dr. Cain might offer in light of my previous opinion. Dr. Cain may testify about factual issues that have not been disputed by defendants and, if the defendants offer the Stocking Study as evidence, Dr. Cain may testify about the study's flaws on rebuttal.

Plaintiffs' motion for reconsideration is therefore denied in part and granted in part. The Clerk of the Court is directed to close this motion (docket # 1878).
